TOE-BOARD SAFETY

As the drill carriage runs back up the table, it creates a safety hazard to anyone standing behind the carriage. An employee is only permitted access to this danger zone when the rig has been shut down and the operator has communicated that it is safe to access. As illustrated in the picture above, the width of the carriage and the narrowness of the cat-walk do not allow easy access to the rear of the carriage. The installation of a toe board is not practical for both safety purposes and normal operating conditions. A toe board would create an additional pinch point as well as change the entire design of the drill rig table and cat-walk. Extreme precaution must be taken when working on the cat-walk.

As an employee of J-C General Engineering, Inc., I have read and understand the safety procedures that must be taken according to J-C General Engineering, Inc.'s Toe-board Safety Practices.
